

## CAMERA FOLLOWING AN OBJECTS MOVEMENT

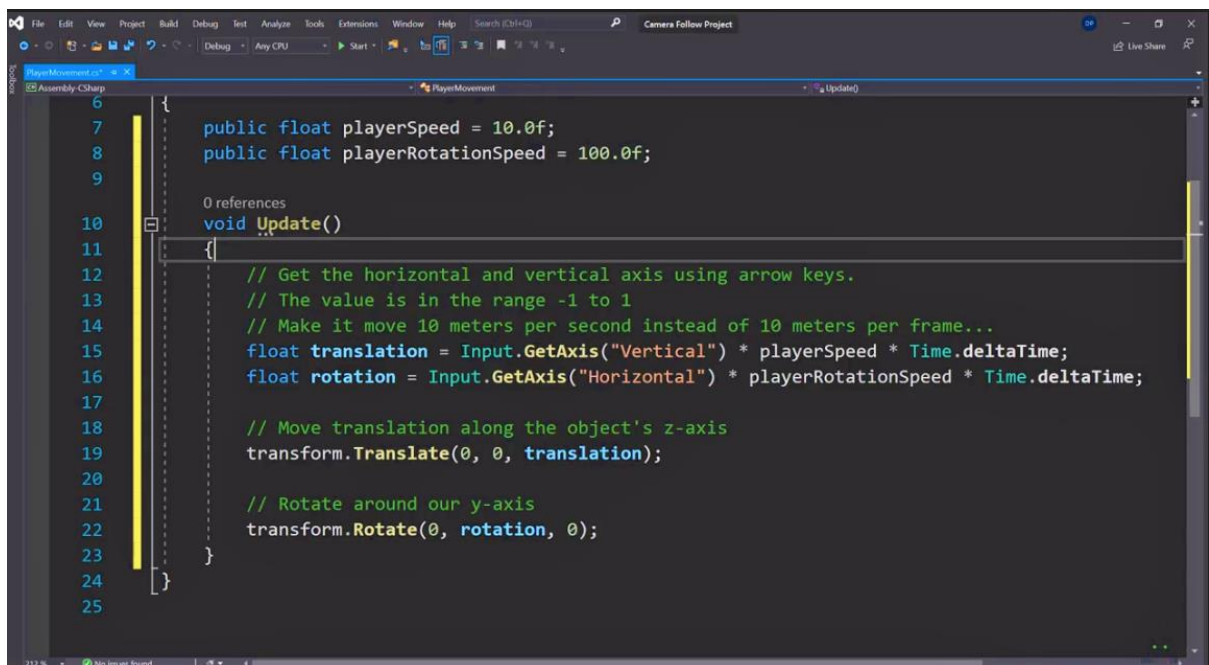

Akshat Singh-20BCG10037

Nehal Pal-20BCG10070

Creating an object and Plane surface.

Codes for moving the object on the Plane created

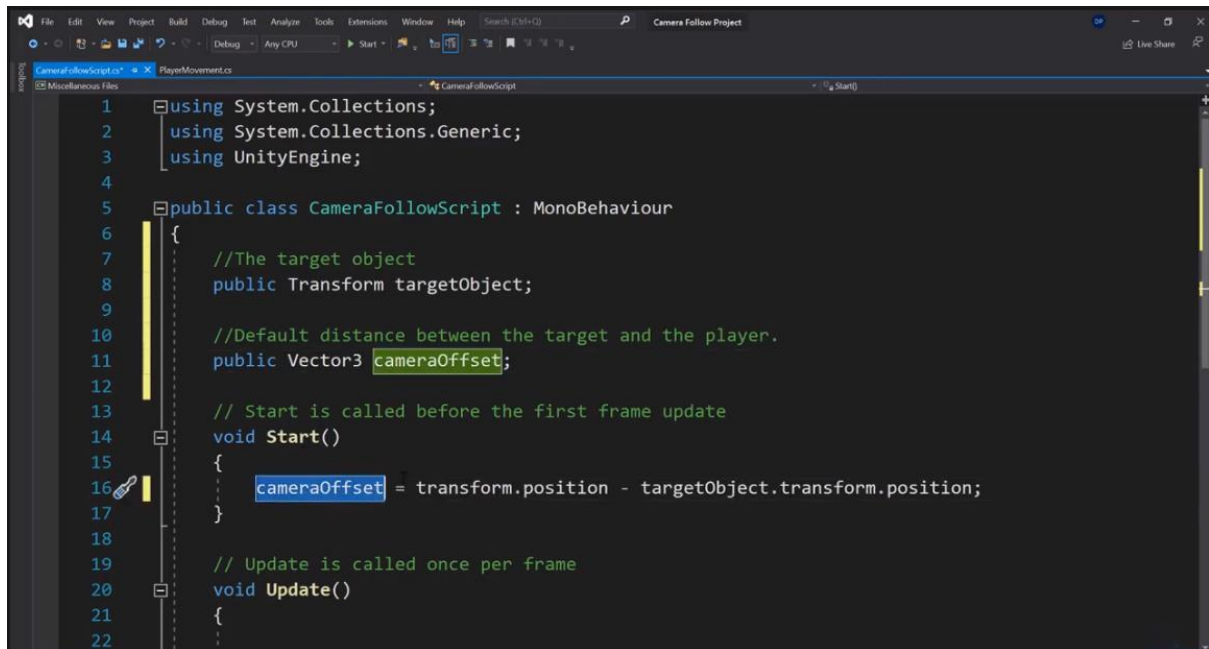

Testing the object movement by looking at the X, Y, Z axis as the initial were (0,0,0)

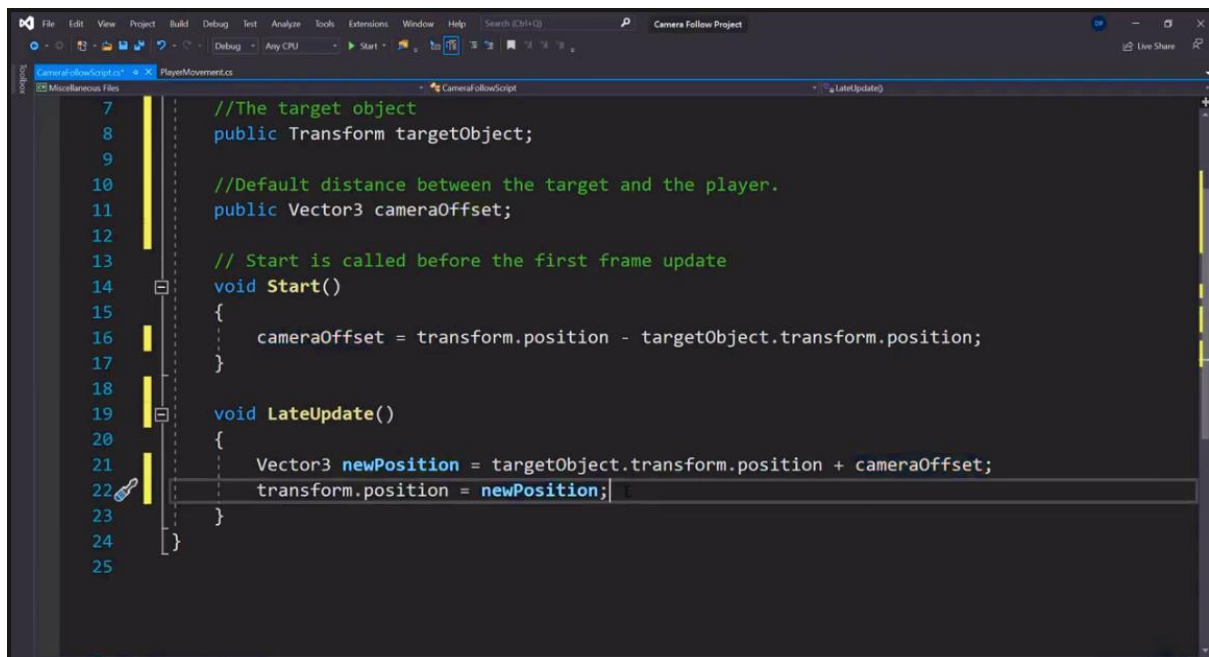

Adding a script for Camera

## Script for camera

```
1 using System.Collections;
2 using System.Collections.Generic;
3 using UnityEngine;
4
5 public class CameraFollowScript : MonoBehaviour
6 {
7     //The target object
8     public Transform targetObject;
9
10    //Default distance between the target and the player.
11    public Vector3 cameraOffset;
12
13    // Start is called before the first frame update
14    void Start()
15    {
16        cameraOffset = transform.position - targetObject.transform.position;
17    }
18
19    // Update is called once per frame
20    void Update()
21    {
22    }
```

```
7 //The target object
8 public Transform targetObject;
9
10 //Default distance between the target and the player.
11 public Vector3 cameraOffset;
12
13 // Start is called before the first frame update
14 void Start()
15 {
16     cameraOffset = transform.position - targetObject.transform.position;
17 }
18
19 void LateUpdate()
20 {
21     Vector3 newPosition = targetObject.transform.position + cameraOffset;
22     transform.position = newPosition;
23 }
24
25 }
```

## Adding a smooth factor

```
10 //Default distance between the target and the player.
11 public Vector3 cameraOffset;
12
13 //Smooth factor will use in Camera rotation
14 public float smoothFactor = 0.5f;
15
16 // Start is called before the first frame update
17 void Start()
18 {
19     cameraOffset = transform.position - targetObject.transform.position;
20 }
21
22 void LateUpdate()
23 {
24     Vector3 newPosition = targetObject.transform.position + cameraOffset;
25     transform.position = newPosition;
26 }
27
28
```

## Adding a look at target object to minimise the jitter

```
16 //will check that the camera looked at on the target or not.
17 public bool lookAtTarget = false;
18
19 // Start is called before the first frame update
20 void Start()
21 {
22     cameraOffset = transform.position - targetObject.transform.position;
23 }
24
25 void LateUpdate()
26 {
27     Vector3 newPosition = targetObject.transform.position + cameraOffset;
28     transform.position = Vector3.Lerp(transform.position, newPosition, smoothFactor);
29
30     //Camera Rotation Change
31     if (lookAtTarget)
32     {
33         transform.LookAt(targetObject);
34     }
35 }
36
37
```

After adding the scripts: - movement of the object and the camera following the object.

## Movement after adding some obstacles
